

Document Engineering Services

INTRODUCING

You envision building efficiency, effectiveness and economy into your organisation when exchanging business information with your customers, suppliers, and others in your trading community. To achieve this you need to create a new model for electronic communication.

Document Engineering Services can help you achieve your vision by designing and implementing electronic document delivery solutions based on open standards.

When you want resources to facilitate or implement business document exchanges with your trading community, you face a challenge...

Individual expert consultants may have a detailed appreciation of your business requirements or an understanding of the appropriate technologies to deliver them, but not many have both. This exposure can create a single point of failure in your project.

The alternative is to engage a large consultancy firm that can provide complete coverage because it has a large number of generalists to put onto your project. It is an expensive form of on-the-job training.

The value of experience

In contrast, our Associate Directors include many international experts who each average over a decade of experience in electronic publishing or electronic business.

We have expertise in designing, building and implementing electronic document exchange systems based on open standards that is second to none.

Our practical experience covers government, resource, logistics, supply chain and service industries.

A global consortium

Document Engineering Services draws on a global consortium of Associate Directors covering a unique range and depth of experience in the commercial delivery of real business solutions.

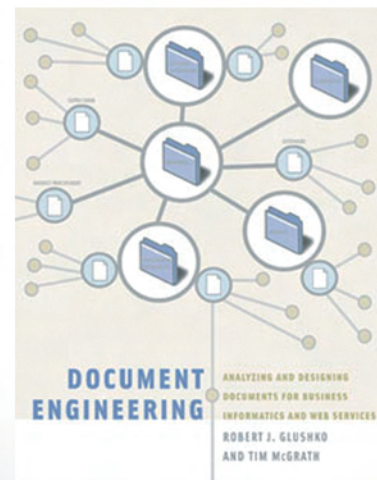

A virtual alternative

Document Engineering Services is a truly virtual business, both in space and time. Resources can be assembled at different times in different places to suit your requirements.

By "assembling to order" a world's best practice team, Document Engineering Services provides both the expertise and the coverage you need.

Future-proofing your investment

Document Engineering Services works with leading standards bodies, academic institutions, and research organizations. We literally wrote the book on Document Engineering.

And we combine this state-of-the-art thinking with a broad range of hands-on skills, from XML technology to business applications and from design to implementation. Our aim is to ensure your investment remains effective. So, if you are serious about better business, you should talk to us.

Management and resourcing

Exchanging electronic documents involves much more than just choosing a technology. In fact, as when introducing any new business processes, successful implementation requires professional and experienced management and resourcing. It's important, for example, to put in place organizational structures for the governance of standards-based document initiatives. Such as the adoption of control frameworks and good practices to help monitor and improve critical activities. These are required to increase business value, reduce business risk and comply with continually increasing regulatory and auditing requirements. Document Engineering Services provides the services you need. Specifically:

- Planning the strategic deployment of your business services.
- Managing your overall project.
- Training (public and in-house) in all areas of business document exchange.
- Implementation and customization of document models based on the Core Component Technical Specification (ISO 15000-5).
- Auditing your firm's capability maturity and its readiness for electronic business.
- Analysing the gap in information between what you have and what you need.
- Building mappings between documents.
- Integrating Back office and EDI systems.
- Advising on document exchange infrastructure.
- Development of products and software tools.
- Establishing a registry of implementation profiles.

Setting the standards, using the standards

Smart businesses recognize they can optimise resources by following, where possible, standardised, rather than specially developed, approaches.

Document Engineering Services is a key player in the development of international open standards such as UN/CEFACT Core Components and the OASIS Universal Business Language standard (UBL).
